

CARBON CHARTER CASE STUDY: WARREN SERVICES

Warren Services offers a turnkey service for a range of mechanical and electrical engineering projects. The business is also involved with the design and conception stages of these projects. The bespoke nature of the organisation's work means it does not run a standard line of products; different projects require different material and process inputs. As a result, associated carbon emissions will vary from job to job.

How Warren Services progressed to Gold:

- 250kW solar PV array installed in 2020.
- Invested in an electric company vehicle in 2021.
- Onsite EV charging points since 2015.
- Electricity is via a renewable tariff.
- Wherever possible, materials and components are locally sourced.
- Local suppliers are promoted to clients for the provision of materials.
- Working alongside EZE truck in the design and manufacturing of the Escher Truck, a zero-emission, cost-effective, 'last mile' solution for urban locations.
- Accredited to environmental management standard ISO 14001.
- Reduced absolute emissions by 34.6% since baseline year of 2016.

"At Warren Services we recognise that our activities impact upon the environment and that we therefore have a moral obligation to operate in an ethical and ecological fashion to support the move towards a more sustainable society. With that in mind we are delighted to have been renewed at Gold and see our efforts recognised!"

William Bridgman - Warren Services
